

MANAGED SERVICES

**Using Managed Services
to Drive Efficient IT**

Introduction

Every business relies on technology to operate. If you're like most organizations, your reliance on technology is growing every year, which means the challenges that come with managing your networks and IT systems are also growing.

According to Gartner, the business technology market worldwide is projected to reach nearly \$4.6 trillion in annual spending in 2023, which is an increase of 5.5% from 2022. Businesses of all sizes are increasing their budgets as they strive to stay on top of IT priorities, such as data security and cloud adoption.

This doesn't just mean that information technology is becoming more important. It also means managing IT is becoming way more complex.

This complexity is making it harder to gain the efficiencies-all this technology promises – which is exactly why managed services have become such a critical asset for businesses today. By outsourcing some or all of your IT tasks to an experienced managed service provider (MSP), you can take back control of your IT.

"... the business technology market worldwide is projected to reach nearly \$4.6 trillion in annual spending in 2023, which is an increase of 5.5% from 2022."

Here's an in-depth look at the specific ways that using managed services can drive efficient IT, helping your business accomplish more and spend less in the long run.

Better Cybersecurity Assurance

Businesses today, and small and medium-sized businesses, in particular, are incredibly vulnerable to cyberattacks. According to the Verizon Data Breach Investigations Report, [43 percent of cyberattacks](#) target small businesses. Once an attack occurs, the financial fallout can be catastrophic. Cybersecurity incidents cost businesses \$200,000 on average.

“43 percent of cyberattacks target small businesses.”

Where your in-house team can only do so much to stop cyber threats, a managed service provider can use a range of techniques to keep your business safe. These include constant monitoring, security awareness training, network and firewall protection, data encryption and backup, and real-time threat prevention and elimination.

Freed-Up IT Resources

When your MSP handles essential tasks such as system monitoring, testing, and help desk support for your employees, your in-house staff is free to work on tasks that can help to drive your business forward.

Right now, they may be spending a good chunk of the day putting out IT ‘fires’ around the office, such as lost passwords or dealing with a piece of hardware that’s not working properly. With an MSP doing the IT support work remotely, your staff can help with building new software and features for existing solutions, consulting with other departments about purchasing new technology, and other business-critical tasks.

Access to Top Experts, Resources, and Tools

When you only have an in-house IT team, you’re limited by the skill set, experience, and tools that the team has to work with. With managed services, you have access to a range of IT experts who know how to use the latest technologies. Also, because an MSP focuses solely on IT, it can focus the bulk of its budget on acquiring worldclass resources and ensuring its staff is up-to-date and knows how to leverage the latest tools in the industry. This level of nearly unlimited access can open up so many doors for your business.

Use of a Full-Time Fully Staffed IT Department at a Fraction of the Cost

Speaking of cost savings, by partnering with a managed services provider, you can tap into a full-time IT department without having to pay all the associated costs. That's right – a fully equipped IT team in your corner that you can afford, even as a small business owner. You won't have to pay for benefits, onboarding, or full-time salaries.

This is one of the ways that managed services aren't just making IT more efficient – they're revolutionizing what small and medium-sized businesses can do with their IT. When you can afford a top-notch, fully staffed team, you can have the time, money, and in-house resources to take your use of technology to the next level.

Proactive Monitoring

With an MSP, you can take a proactive approach to your IT network. Your managed services provider will monitor your network remotely around the clock, which means you have experienced professionals looking out for any potential issues before they become a problem.

This can help your business to avoid expensive downtime. It can also empower you to make smarter decisions regarding your IT systems – your MSP can provide regular reports on your network's performance and vulnerabilities that you can use to figure out when to upgrade systems, increase your cybersecurity, or take other vital actions.

Consistent Monthly Rate

Using managed services can also make it easier to direct your IT budget for the new solutions and hardware you need. Because you only pay a fixed monthly rate with an MSP, you can predict how much you'll need to spend and determine what you can use for future IT investments.

Reliable Response Services

How much time do your employees waste waiting for help with setting up their account or troubleshooting their tech issues? When you partner with an MSP, you'll be able to count on fast, reliable response times. Your employees will experience less disruption to their workflow – and less frustration.

Cloud Computing and Data Backup

Over 60 percent of all corporate data worldwide is stored in the cloud, in some shape or form, in 2022. While cloud technology offers everything from great flexibility to enhanced business continuity, it's also one more thing for your IT team to manage. Partnering with an MSP that offers cloud services including cloud monitoring, cloud migration, and cloud backup can streamline your experience using the cloud.

“Over 60 percent of all corporate data worldwide is stored in the cloud, in some shape or form, in 2022.”

Simplify the Lives of Employees

Using a managed services provider can make everything from software upgrades to cloud migrations smoother. Your MSP can prevent downtime and handle IT issues for your workers fast. Even more importantly, managed services allow your IT resources to focus on creating apps, functions, and other solutions that will make the workflows of your employees even more streamlined. All this adds up to a more efficient, more productive, better-empowered business.

The More Efficient Your IT is, the More You Can Leverage IT for Your Business Goals

Your IT is at the heart of everything from communications to managing workflows. The better you can manage it, the more you can get out of it. Why struggle with your IT when you can keep your networks secure, save money, and devote your resources to developing even more useful ways to make technology service your business?
